

Why VoIP? Why Comdial?

Cost-Effective Voice Networking for Small and Medium-Size Businesses

Voice-over-IP (VoIP) no longer belongs only to the Fortune 500. By piggybacking inter-office voice traffic over their existing IP data network, small and medium-size businesses are drastically reducing communication costs. We're not surprised.

Unlike some of our competitors, we don't sell televisions, DVD players or refrigerators. Nor are we a data-centric vendor with a limited understanding of voice communication requirements. Comdial's sole focus for the past 25 years has been providing innovative business communications solutions to small and medium-size enterprises.

Our award-winning FX II Converged Telephony Platform, simultaneously supports digital voice communication and IP functionality. This design allows a company to implement VoIP at a pace consistent with its business needs, all at once or in incremental steps. The Converged Telephony Platform also supports unified voice, fax and email messaging, auto-attendant voicemail and call center applications.
